Workaround for deleting event codes:

Users have not been able to delete event codes from RPAs since the Family Pack Patch was released in mid-October for DCPDS. This affects users ability to pull accurate data when using the AF RPA Tracker. The problem has been reported but might not be fixed as quickly as we would like. The following workaround has been successfully tested. Please begin using immediately.

Insert "IEC" in comments field of <u>any</u> event code you want to delete and save. The event code <u>will remain</u> on the RPA but it will be eliminated from any reports we run using the AF RPA Tracker. (IEC = Invalid Event Code)

For example: This RPA is not a true AFPC Fill and the event code, G07000 needs to be deleted. Type "IEC" in the comments field of event code G07000 and save. This will eliminate that RPA from any report that looks for AFPC Fills.
